

GOLDITY (GDTY)

Official Whitepaper — Version 1.0

Digital value on BNB Smart Chain

1. Token Overview

GOLDITY (GDTY) is a fixed-supply digital asset deployed on BNB Smart Chain. Network: BNB Smart Chain. Chain ID: 56. Decimals: 18. Total supply: 19,100,000 GDTY.

2. Official Contract

Contract address: 0x76D89e26502d0aA9bf83DA222cfCF12a27Ead801. Users should verify the complete address before interacting with GDTY. The official website provides a dedicated contract page and explorer link.

3. Contract Mechanics

The deployed contract has no mint function and uses a fixed supply. Holders can burn their own tokens. Buy tax is 0.05%, sell tax is 0.05%, and wallet-to-wallet transfers are 0%. The deployed logic includes two-step ownership and configurable tax-exemption status for registered pair/vesting addresses.

4. Market Data Method

The GOLDITY website uses live on-chain reserve data for current pool state. Its Reference Price is the arithmetic mean of valid GDTY/USDT prices from the configured Uniswap V2 and PancakeSwap V2 pools. When a source is unavailable, only valid sources are used. When no valid source exists, the site reports unavailable instead of inventing a value.

5. Accounts and Referral Codes

Users can create an account with minimum registration information. Each approved account receives a unique referral code. A new registration may enter a valid existing code, creating referral attribution. A referral code is not a guarantee of financial compensation. Any future token or financial reward requires separately published terms and applicable legal/compliance review.

6. Privacy and Data Minimisation

The standard registration form is designed to collect first name, last name, email, country, optional phone number, referral attribution and optional marketing consent. It does not request government identification. Personal data should be processed for specified purposes, using an appropriate legal basis, with data minimisation, security and retention controls.

7. KYC / AML

KYC (Know Your Customer — ██████████ ██████████ ██████████) and AML (Anti-Money Laundering — ██████████ ██████████ ██████████) controls are jurisdiction- and activity-dependent. The registration form does not itself constitute KYC. Before any regulated sale, custody, brokerage or other regulated service is offered, the applicable legal and compliance requirements must be assessed and implemented.

8. Risks and Disclaimer

Digital assets can be volatile and may lose some or all of their value. Smart contracts, wallets, exchanges, RPC services and third-party data providers can fail. Nothing in this document guarantees a return, price, liquidity or exchange listing. Users remain responsible for their own transactions and applicable laws.

9. Website Documents

The official website should publish this Whitepaper together with the Contract page, Terms of Use and Privacy Notice. The legal entity, privacy contact and jurisdiction-specific provisions should be inserted after legal review before public launch.
